# Impulse signal spectrum

#### The purpose of work

It is necessary to obtain graphs of a square signal (single polar meander) with frequencies of 1,2,4,8 hertz and the spectra of these signals.

### Imports of necessary libraries

```
%matplotlib notebook
from numpy import sin, cos, linspace, cumsum, asarray, zeros
from scipy.fft import rfft, rfftfreq, irfft, fft
from scipy.signal import square
from math import *
import matplotlib.pyplot as plt
```

#### **Core functions**

```
# Static global variables to work with the signal
TIME_RANGE = 4  # Time range (sec)
FS = 2048 # Sampling freq (Hz)
SAMPLES = FS * TIME_RANGE # Count of samples
{\tt def t\_step(samples=SAMPLES):}
   Generates a time steps array
    TIME_STEP = 1 / FS # Sample time interval
    return linspace(0, TIME_RANGE, samples)
